

Auto-Populated Repair Documentation

Business Problem

The current system requires the electronics technician to manually enter electronics part numbers into the Failure and Defect section for the parts they've ordered, even though a record of the part number is already generated in the part-lookup system whenever a part is ordered. Technicians often end up manually entering ten or more parts into the Failure and Defect section. With over 30 technicians performing this process year-round, this is time wasted that could be saved through a relatively minor overhaul of the current system.

Objective

Overhaul the current Failure and Defect system so that the part numbers of parts ordered in the part-lookup system auto-populate.

Scope

Failure and Defect system.

Part-lookup system.

Microsoft Access.

Requirements

- **FR-01:** The Failure and Defect section shall retrieve the associated unit's ordered part numbers recorded in the part-lookup system.
- **FR-02:** The Failure and Defect section shall automatically populate the corresponding part numbers.
- **FR-03:** The technician shall be able to review the populated information in the Failure and Defect section before completing the repair record.
- **FR-04:** The technician shall be allowed to manually alter part numbers in the Failure and Defect section.
